Select the appropriate cutting blade for your Hot Knife Groover. Working from predetermined markings on your substrate cut your groove in the EPS insulation.

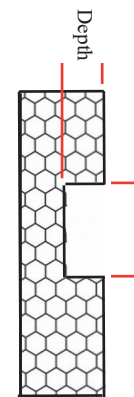

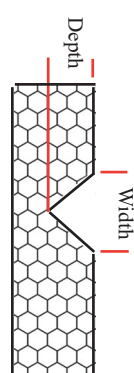

After coating your groove with base coat, place a workable width of mesh on top of the precut groove. Then move the matching groove sled forward to imbed the mesh and remove any excess base coat. The sled will push the mesh into your base coat evenly, filling the precut groove and eliminating any snags or cuts in the mesh that might occur with an ordinary trowel.
